AXP2101 Single Cell NVDC PMU with E-gauge

1. Features

- 3.9V–5.5V Input Operating Range and Support single Cell Battery
- Battery fuel gauge: E gauge 3.0
- Support TWSI(Two Wire Serial Interface) and RSB(Reduced Serial Bus)
- 100mA-1A Linear charger, CV accuracy +/-0.5%
- Single input to support USB input
- High battery discharge efficiency with 50 mOhm
- High integration includes all MOSFETS, current sensing and loop compensation
- Power off current <20uA（BATFET off，RTCLDO output on）
- 4 DCDC
  DCDC1:1.5~3.4V, IMAX=2A;
  DCDC2: 0.5~1.2V, 1.22~1.54V, IMAX=2A
  DCDC3: 0.5~1.2V, 1.22~1.54V, 1.6~3.4V, IMAX=2A
  DCDC4: 0.5~1.2V, 1.22~1.84V, IMAX=1.5A
  DCDC5: 1.2V, 1.4~3.7V, IMAX=1A.
- 11 LDOS
  RTCLDO1~2: 1.8V/2.5V/3V/3.3V, 30mA; Support RTCLDO1 supplied by backup battery (button battery)
  ALDO1~4: analog LDO,0.5~3.5V, 0.1V/step, IMAX=300mA
  BLDO1~2: analog LDO,0.5~3.5V, 0.1V/step, IMAX=300mA
  CPUSLDO: for CPUs, 0.5~1.4V, IMAX=30mA
  DLDO1~2: analog LDO or power switch, 0.5~3.5V/ 0.5~1.4V, IMAX=300mA
- startup sequence and default voltage of DCDC/LDO setting
- Protection
  Input Over-Voltage Protection
  Battery Thermal Sense Hot/Cold Charge Suspend
  Programmable Safety Timer for Charger
  Die Thermal Balance for Charger
  Thermistor Shutdown
  DCDC Over-Voltage/Under-Voltage Protection

2. Applications

- SDV, Car DVR, IPC, smart doorbell, smart speaker

3. Description

AXP2101 is a highly integrated power management IC(PMIC) targeting at single cell Li-battery(Li-ion or Li-polymer) applications that require multi-channel power conversion outputs. It provides an easy and flexible power management solution for multi-core processors to meet the complex and accurate requirements of power control.

AXP2101 supports Linear charge. Besides, it supports 15 channel power outputs which include 5 channel DC-DC and 11 channel LDO. To ensure the security and stability of the system, AXP2101 provides multiple channels 14-bit ADC for voltage/temperature monitor and integrates protection circuits such as over-voltage protection(OVP), over-current protection(OCP) and over-temperature protection(OTP). Moreover, AXP2101 features a unique E-Gauge™ (Fuel Gauge) system, making power gauge easy and exact.

AXP2101 supports TWSI and RSB for system to dynamically adjust output voltages, charge current and configure interrupt condition.

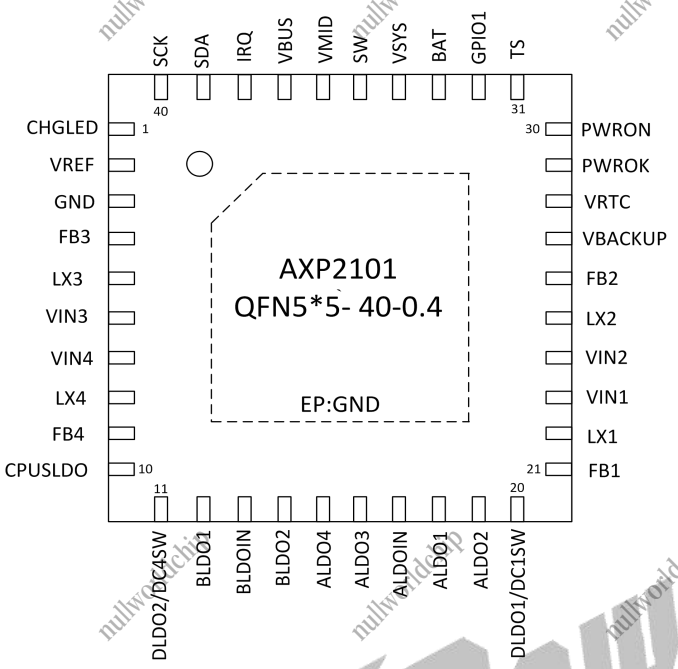
5. Pin Configuration and Functions



Pin Description

NO.	Pin Name	Type	Description
1	CHGLED	AO	Charge status output to indicate various charger operation.
2	VREF	P	Internal reference voltage
3	GND	AI	Analog ground for interrupt analog and digital circuits.
4	FB3	P	DCDC3 feedback pin
5	LX3	P	Inductor pin for DCDC3
6	VIN3	P	DCDC3 input source
7	VIN4	P	DCDC4 input source
8	LX4	P	Inductor pin for DCDC4
9	FB4	P	DCDC4 feedback pin and Switch input source
10	CPULDOS	P	Output pin of CPULDOS
11	DLDO2/DC4SW	DO	Output pin of DLDO2,and can be configured as the Output pin of DC4SW
12	BLDO1	P	Output pin of BLDO1
13	BLDOIN	P	BLDO input source
14	BLDO2	P	Output pin of BLDO2
15	ALDO4	P	Output pin of ALDO4
16	ALDO3	P	Output pin of ALDO3
17	ALDOIN	P	ALDO input source
18	ALDO1	P	Output pin of ALDO1
19	ALDO2	P	Output pin of ALDO2

20	DLDO1/DC1SW	P	Output pin of DLDO1,and can be configured as the Output pin of DC1SW
21	FB1	P	DCDC1 feedback pin
22	LX1	P	Inductor pin for DCDC1
23	VIN1	P	DCDC1 input source
24	VIN2	P	DCDC2 input source
25	LX2	P	Inductor pin for DCDC2
26	FB2	AI	DCDC2 feedback pin
27	VBackup	P	input pin of backup battery
28	VRTC	P	RTC power output
29	PWROK	DIO	Power good indication output
30	PWRON	DIO	Power On-Off key input，Internal 100k pull up to VINT
31	TS	AI	Temperature qualification voltage input. Connect a negative temperature coefficient thermistor from TS to GND. A current source is injected to TS pin and convert TS voltage to a digital code. Charging suspends when TS pin is out of range. Besides, TS can be connected to external input signal.
32	GPIO1/FB5/RTC LDO2	DIO	Output pin of GPIO1 and can be configured as the Output pin of RTCLDO2 or DCDC5 feedback pin.
33	BAT	P	Battery connection point. The internal BATFET is connected between BAT and SYS. Connect a 1uF capacitor closely to the BAT pin.
34	VSYS	P	System connection point. The internal BATFET is connected between BAT and SYS. Connect two 22uF capacitors closely to the SYS pin.
35	SW	P	Inductor pin for DCDC5
36	VMID	P	VMID Power output
37	VBUS	P	Vbus input
38	IRQ	DIO	Open-drain interrupt Output. Connect the IRQ to a logic rail via a 4.7kΩ resistor. The IRQ pin sends a low level signal to host to report charger device status and fault.
39	SDA	DIO	Data pin for serial interface, needs a 2.2KΩ Pull High.
40	SCK	DI	SCK pin for serial interface, needs a 2.2KΩ Pull High.
EP	EP	GND	Exposed Pad, needs to be connected to system ground

6. Specifications

6.1 Absolute Maximum Ratings (1)

Over operating free-air temperature range (unless otherwise noted)

SYMBOL	DESCRIPTION	MIN	MAX	UNIT
VBUS	Voltage range(with respect to GND)	-0.3	12	V
Others pin (exp vbus,pgnd, gnd)		-0.3	7	V
		-0.3	7	V
PGND to GND		-0.3	0.3	V
Ta	Operating Temperature Range	-40	85	℃
T_J	Junction Temperature Range	-40	125	℃
Ts	Storage Temperature Range	-65	150	℃
T_{LEAD}	Maximum Soldering Temperature (at leads，10sec)		30	℃

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V_{ESD}	Human body model(HBM)(1)	±4000	V
	Charged device model(CDM)(2)	±750	V

(1) Reference: ESDA/JEDEC JS-001-2014. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) Reference: ESDA/JEDEC JS-002-2014. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

SYMBOL	DESCRIPTION	MIN	MAX	UNIT
V_{IN}	Input voltage(VBUS)	3.9	5.5	V
I_{IN}	Input current(VBUS)		2	A
I_{SYS}	Output current		2	A
V_{BAT}	Battery voltage		4.4	V
I_{BAT}	charging current		1	A

6.4 Thermal Information

Thermal Metric(1)		VALUE	UNIT
θ_{JA}	Junction-to-ambient thermal resistance	30	℃/W
θ_{JB}	Junction-to-board thermal resistance	10.8	
θ_{JC}	Junction-to-case(top) thermal resistance	22.8	

(1)Thermal metrics are calculated refer to JEDEC document JESD51.

7. Detail Description

7.1 Overview

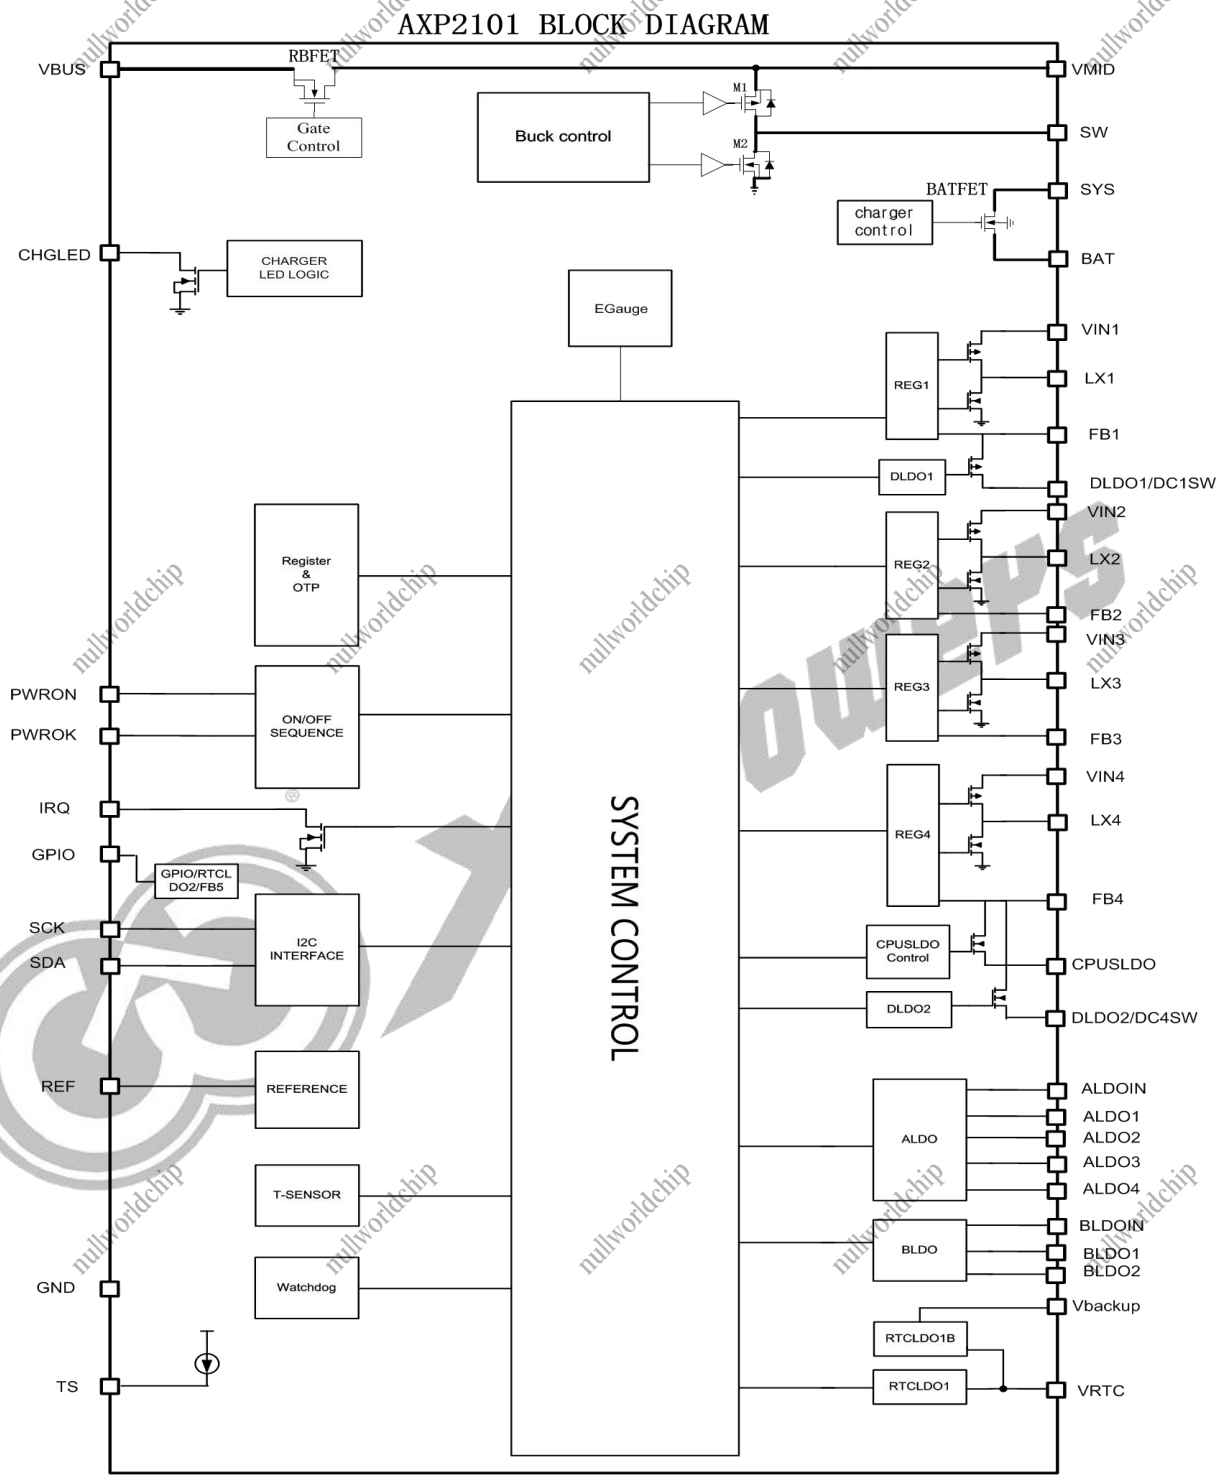
AXP2101 is a highly integrated power management IC(PMIC) targeting at single cell Li-battery (Li-ion or Li-polymer) applications that require multi-channel power conversion outputs. It provides an easy and flexible power management solution for multi-core processors to meet the complex and accurate requirements of power control.

AXP2101 supports 100mA-1A Linear charge. Besides, it supports 15 channel power outputs which include 5 channel DC-DC and 11 channel LDO. To ensure the security and stability of the system, AXP2101 provides multiple channels 14-bit ADC for voltage/temperature monitor and integrates protection circuits such as over-voltage protection(OVP), over-current protection(OCP) and over-temperature protection(OTP). Moreover, AXP2101 features a unique E-Gauge™ (Fuel Gauge) system, making power gauge easy and exact.

AXP2101 supports TWSI and RSB for system to dynamically adjust output voltages, charge current and configure interrupt condition.

AXP2101 is available in 5mm x 5mm 40-pin QFN package.

7.2 Function Block Diagram



7.3 Serial Interface Communication

AXP2101 supports TWSI protocol and performs as a TWSI slave device with default address 0x68/0x69. When AXP2101 powers on, SCK/SDA pin of TWSI will be pulled up to IO Power and then Host can adjust and monitor AXP2101 with rich feedback information.

Besides, AXP2101 supports RSB for Allwinner platform with address 0x01D1 or 0x0273 by customer.

Note: "Host" here refers to system processor.

7.4 Power Path

VBUS as the charger input, connecting to VSYS pin through a Linear charger, provides power to system and charges battery through BATFET. Charge current can be adjusted automatically according to the feedback current which is detected with an internal resistor. When system current (I_{SYS}) changes, the detected current will change, and then the current change signal will feed back to charge loop to adjust the charge current to the setting value.

When battery voltage is above V_{SYS}, BATFET is turned on and PMU enters supplement mode. When in supplement mode, if the discharge current is lower than 1A, PMU controls the voltage(V_{DS}) between system and battery and keeps V_{DS} at 30mV to avoid entering and exiting supplement mode repeatedly. As discharge current increases, PMU adjusts BATFET to be fully on and V_{DS} increases linearly. If an adapter is not inserted, system current is provided only by battery. At this time, BATFET is at fully on state.

7.5 Power On/Off and reset

7.5.1 Power on reset(POR)

AXP2101 is powered from the higher voltage between VBUS and BAT. When VBUS voltage(V_{VBUS}) is higher than V_{VBUS_UVLOZ} or BAT voltage(V_{BAT}) is higher than V_{BAT_UVLOZ}, the sleep comparator, battery depletion comparator and BATFET driver are be activated. All registers are reset to the default value. TWSI communication is active and Host can communicate with PMU.

7.5.2 Power up from BAT

If only battery is present and V_{BAT} is higher than depletion threshold (V_{BAT_DPLZ}), BATFET, connecting battery to system, is off by default and need to be turned on by pressing the PWRON key or inserting an adapter.

7.5.3 Power up from VBUS

When VBUS is inserted, PMU detects the input voltage to start up the reference voltage and the bias circuit. When V_{VBUS} is higher than V_{VBUS_UVLOZ}, the VBUS insertion IRQ is sent and the register bit reg49H[7] is set to 1 to indicate VBUS is inserted. Then PMU detects the input source whether it is good or not. If Vbus is good, the RBFET is open and Vsys is working.

7.5.3.1 Good source condition

PMU needs to check the current capability of the input source. Only when the input source meets the following

requirements can it start the buck converter.

a. VBUS voltage is lower than V_{ACOV}

b. VBUS voltage is higher than $V_{VBUSMIN}$ when pulling I_{BADBUS}(typical 30mA)

Once the input source meets the requirements above,the register bit reg00H[5](VBUS_GD) is set to 1 to indicate the input source is good.

7.5.3.2 Set input voltage limit(V_{INDPM})

AXP2101 supports wide range of input voltage(3.9V~5.5V). V_{INDPM} can be set through reg15H[3:0]. The range of V_{INDPM} is from 3.88V to 5.08V and the step is 80mV.

When VBUS voltage reaches V_{INDPM}, the charge current will decrease automatically until the current is zero. If I_{SYS} is over the input power supply capability, V_{SYS} will drop. If V_{BAT} is above V_{SYS}, PMU will enter the supplement mode.

7.5.4 System power on/off management

PMU has power off and power on status. When at off state, all voltage outputs are turned off except RTCLDO . At this time, the total power consumption is typically 25uA.

7.5.4.1.Power on-off Key (POK)

EN/PWRON pin can be configured as PWRON pin or EN pin by customization. The default is PWRON pin. The Power on-off Key (POK) can be connected between PWRON pin and GND of AXP2101. AXP2101 can automatically identify the four status (Long-press, Short-press, Negative edge, Positive edge) and then correspond respectively.

7.5.4.2.Power on

1.When EN/PWRON pin is configured as PWRON pin, power on sources include:

(1). POK. AXP2101 can be powered on by pressing and holding POK for a period of time that longer than "ONLEVEL".

(2). VBUS low go high. The function can be configured by customization.

(3). VBAT low go high. The function can be configured by customization.

(4). IRQ Low level. IRQ pin is low level for more than 16ms, AXP2101 will be powered on.The function can be configured by customization.

(5) . Battery is charged to normal (Vbat>3.3V and is charging). The function can be configured by customization.

2.When EN/PWRON pin is used as EN pin, AXP2101 can be powered on by EN pin from low go high(0.6V).

After power on, DC-DC and LDO will be soft booted in preset timing sequence. When IRQ low level power on, AXP2101 can be configured for fast power on by REG2B, and the DCDsC/LDOS start sequence can be configured by REG28~REG2B.

7.5.4.3.Power Off

1.When EN/PWRON pin is configured as PWRON pin, power off sources include:

(1). POK. AXP2101 can be powered off by pressing and holding POK for a period of time that longer than "OFFLEVEL". The function can be configured by REG22H [1] and REG22H [3:2] decides whether the PMU auto turns on or not when it shuts down after OFFLEVEL POK.

(2). Write “1” to REG10H [0].

(3). VSYSGOOD high go low. When VSYS<VOFF or VBUS>7V, AXP2101 will be powered off. The default of VOFF is 2.6V which can be configured by REG24H[2:0].

(4). The output voltage of DCDC is 15% lower than the setting value. The function can be configured by REG23H [4:0].

(5). The output voltage of DCDC is much larger than their setting. The function can be configured by REG23H [5].

(6). Die temperature is over the warning level2(145℃). The function can be configured by REG22H [2].

7.5.4.4.Sleep and wakeup

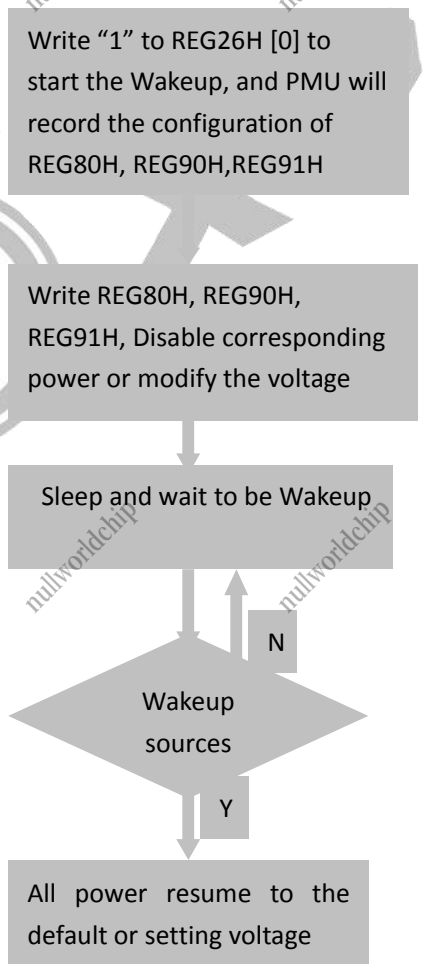
When the running system needs to enter Sleep mode, Maybe one or several power outputs should be disabled or changed to other voltage. Wakeup can be initiated by the following sources:

1.Software wakeup (REG26H [1] is set to 1)

2.IRQ pin wakeup (REG 26H [4] =1 and IRQ pin is low level for more than 16ms)

These sources will make the all the PMU power outputs resume to the default voltage or the setting voltage, which is configured by REG26H[2], and all shutdown powers will resume by the startup sequence.

See the control process under sleep and wakeup modes as below:



7.5.4.5.Reset

The PMU has system reset and power on reset.

- System reset

System reset means the registers will be reset when PMU is powered on. at system reset state, all voltage outputs are turned off except RTCLDO and VREF. There are three ways of system reset.

(1). PWROK drive low.

The PWROK pin can be used as the reset signal of application system. During AXP2101 startup, PWROK outputs low level, which will be pulled up to startup the system after output voltage reaches the regulated value.

When application system works normally, If the PWROK pin is driven low by external key or other reasons, the PMU will be restarted. The function can be configured by REG10H [3].

(2). Write "1" to REG10H [1] to restart the PMU.

(3). Watchdog timeout. The function can be configured by REG18[0] and REG19[5:4]

- Power on reset

Power on reset means the registers will be reset when PMU is powered up. at power on reset state, all voltage outputs are turned off including RTCLDO and VREF.

7.6 Multi-Power Outputs

The following table has listed the multi-power outputs and their functions of AXP2101.

Output Path	Type	Default Voltage	Startup Sequence	Application Suggestion	Load Capacity(Max)
DCDC1	BUCK	3.3V	3	IO/USB	2000mA
DCDC2	BUCK	0.9V	3	CPU	2000mA
DCDC3	BUCK	0.9V	2	VSYS	2000mA
DCDC4	BUCK	1.1V	1	DDR	1500mA
DCDC5	BUCK	1.2V	OFF	N/A	1000mA
ALDO1	LDO	1.8V	3	N/A	300mA
ALDO2	LDO	2.8V	OFF	N/A	300mA
ALDO3	LDO	3.3V	3	N/A	300mA
ALDO4	LDO	2.9V	OFF	N/A	300mA
BLDO1	LDO	1.8V	OFF	N/A	300mA
BLDO2	LDO	2.8V	OFF	N/A	300mA
DLDO1	LDO	3.3V	OFF	N/A	300mA
DLDO2	LDO	1.2V	OFF	N/A	300mA
VCPUS	LDO	0.9V	1	CPUs/Reference of DDR	30mA
RTC-LDO1	LDO	1.8V	Always on	RTC	30mA
RTC-LDO2	LDO	OFF	OFF	N/A	30mA

AXP2101 includes 5 synchronous step-down DCDCs, 11 LDOs and one switch. The work frequency of DC-DC 1/4 is 3MHz and DCDC2/3/5 is 1.5MHz. External small inductors and capacitors can be connected. In addition, 4-ch DCDCs can be set in fixed PWM mode or auto mode (automatically switchable according to the load). See register REG81H.

DCDC2/3 has DVM enable option. In DVM mode, when there is a change in the output voltage, DCDC will change to the new targeted value step by step. It supports two kinds of DVM slope: 1 step/15.625us and 1step/31.250us. The slope can be chosen by REG80H [5].

AXP2101 can configure the default voltage, the startup sequence and other control of all power output.
Startup sequence ： The startup sequence has eight levels from 0 to 7. When the sequence is 0, it means the output is booted at the first step. When the sequence code is 1, it means the output is booted at the second step. When the sequence is 7, it means the output is not booted.
Default voltage setting: The default voltage of each channel can be set to each step within the output range.

7.7 Charger

7.7.1 Characteristics

- Range of input voltage:3.9V~5.5V, PWM charger, supports single cell Li-battery
- Pre-charge current settable ($I_{PRE-CHG}$, reg61 [3:0]), default:125mA, range: 0mA~200mA,step:25mA
- Fast charge current settable (I_{CHG}, reg62[4:0]), default:1024mA, range: 0mA~200mA,step:64mA, 200~1000mA,step:100mA
- Target charge voltage settable (V_{REG}, reg64[2:0]), default:4.2V, range: 4.0v/4.1v/4.2v/4.35v/4.4v/4.6v
- Accuracy of target voltage:±0.5%(testing ambient temperature:25℃,target voltage:4.2V)

7.7.2 Charging condition

- VBUS is present and available, $V_{VBUS}>V_{BAT}+V_{SLEEPZ}$
- Input source detection finishes (reg00H [5] =1)
- Charging is enabled (reg18H [1] =1)
- Die temperature is lower than T_{SHUT}
- When TS pin is used to detect battery temperature, battery temperature is within the chargeable range
- V_{BAT} is lower than V_{BAT_OVP}
- No charger safety timer fault

7.7.3 Charging process

When PMU meets all charging conditions, it can complete the whole charging process without the participation of Host. The charging status can be known from the register bits reg01H[2:0]. The default values of charging parameters are shown as following. Host can modify registers to optimize the values through TWSI.

Table 7-1

Parameter	Default value
Charging voltage	4.208V
Charging current	1.024A

Pre-charging current	125mA
Termination current	125mA
Temperature profile	Cold/hot
Safety timer	12hours

7.7.3.1. Pre-charge

When V_{BAT} is lower than $V_{BATLOWV}$(3V), the charger is under pre-charge mode where charging current is limited to a value of $I_{PRE-CHG}$. Safety time is set through reg67H [1:0] and its default value is 50 minutes. If pre-charge process times out, PMU will stop charging and send a corresponding IRQ to Host. The function of safety timer can be disabled through reg67H [2].

7.7.3.2. Constant current charge

Once V_{BAT} is higher than $V_{BATLOWV}$ and lower than V_{REG}, the charger is under constant current charge mode. It will charge with constant current I_{CHG}.

7.7.3.3. Constant voltage charge

When V_{BAT} reaches target voltage (V_{REG}), the charger enters constant voltage charge mode. In this stage, the charger keeps the output voltage constant and step down charging current gradually, in order to fully charge battery.

When V_{BAT} is above V_{RECHG} and the charging current reduces under termination current (I_{TERM}), AXP2101 reports charger done, stops charging (charger enable bit is still 1) and turns off BATFET. Meanwhile, IRQ is sent to Host.

When AXP2101 is in regulation of input current, input voltage or temperature, the function of charging termination configured through reg63 [4] is temporarily disabled and the speed of safety timer slows down. Whether to set safety timer during DPM or thermal regulation depends on reg67H [7].

7.7.3.4. Re-charge

After charge done, if V_{BAT} falls below V_{RECHG}, PMU will automatically enable charger without reinserting adapter.
No matter whether V_{BAT} is above V_{RECHG} or not, the charger is enabled when an adapter is inserted.

7.7.3.5. Battery detection

As long as an AC adapter is present and usable, battery detection will be enabled to detect whether battery is connected. Battery detection function is enabled by default and can be disabled through reg68H [0]. If the function is disabled, PMU considers that battery is always present. The detection result is saved in reg00H [3]

7.7.4 Charging protection

7.7.4.1. charger safety timer

Once starting pre-charge mode, PMU will enable timer1. If PMU cannot enter constant current charge mode from pre-charge within 50min (set through reg67H [1:0]), PMU will enter battery safe mode and send IRQ to indicate the battery may be damaged.

When the charger enters into constant current charge mode, PMU will enable timer2. If PMU cannot finish the whole charge cycle within 12 hours (set through reg67H [5:4]), PMU will enter battery safe mode and send IRQ to indicate the battery may be damaged.

Timing speed of timer1 or timer2 is relevant with actual charge current. The smaller the actual charge current, the slower timing speed is.

7.7.4.2. Battery safe mode

In battery safe mode, the charger always charges with 10mA current. PMU can quit battery safe mode with one of the following methods:

- $V_{BAT}>V_{RECHG}$
- Adapter removal
- Charger enable bit (reg18H [1]) is reset to 1
- Safety timer1 enable bit or safety timer2 enable bit is reset to 1

7.7.4.3. PMU die temperature protection

AXP2101 has built-in temperature protection function through ADC to monitor internal temperature.

Under charging mode, the temperature point of thermal regulation can be set through reg65H [1:0]. When die temperature rises up to the setting point, the charging current will be decreased to decrease heat. When thermal regulation works, actual charge current is lower than the setting value and thermal regulation status(reg00H [1]) is set to 1. If die temperature rises up to T_{SHUT} (145℃), IRQ is sent, PMU is poweroff. When die temperature falls below hysteretic threshold (120℃), PMU is not poweron automatically.

7.7.4.4. Battery temperature protection

AXP2101 can monitor battery temperature, when TS pin is used to detect battery temperature and parallel with charger(reg50H[4]=0). The battery temperature sensitive resistor is connected between TS pin and GND. The suggestion resistance should be 10Kohm at 25℃ ambient temperature. Through TS pin, PMU outputs constant current which can set through reg50H [1:0] to adapt different resistance. When the resistance is 10Kohm, the current should be set to 50uA. The enable bit of TS current source is configured through reg50H [3:2]. When current passes through the temperature sensitive resistor, PMU gets a detected voltage and calculates its value through ADC circuit. Take for example, TH11-3H103F temperature sensitive resistor of Mitsubishi Company. Using 50uA current source, the relationship among temperature, equivalent resistance, detected voltage and ADC data is as following.

Table 7-2

Temperature	equivalent resistance	detected voltage	ADC DATA
-20℃	63.00Kohm	3.150V	189Ch
-15℃	50.15Hohm	2.508V	1398h
-10℃	**40.26Kohm**	**2.013V**	**FBAh**
-5℃	32.55Kohm	1.628V	CB8h
0℃	**26.49Kohm**	**1.325V**	**A5Ah**
5℃	21.68Kohm	1.084V	878h
10℃	17.78Kohm	0.889V	6F2h
15℃	14.63Kohm	0.732V	5B8h
20℃	12.07Kohm	0.604V	4B8h
25℃	10.00Kohm	0.500V	3E8h

30℃	8.320Kohm	0.416V	340h
35℃	6.954Kohm	0.348V	2B8h
40℃	5.839Kohm	0.292V	248h
45℃	**4.924Kohm**	**0.246V**	**1ECh**
50℃	4.171Kohm	0.209V	1A2h
55℃	**3.549Kohm**	**0.177V**	**162h**
60℃	3.032Kohm	0.152V	130h

During battery charging process, if TS pin voltage is lower than VHTF-CHG or higher than VLTF-CHG (VHTF-CHG and VLTF-CHG can be set through reg55H and reg54H. The default value of VLTF-CHG is set around 0℃ and VHTF-CHG around 45℃), which indicates battery temperature is too high or too low, then the charger is paused and IRQ is sent to notify Host. When battery temperature is back to the normal range, the charger will recovery automatically.

During battery discharging mode, if TS pin voltage is lower than VHTF-WORK or higher than VLTF-WORK (VHTF-WORK and VLTF-WORK can be set through reg57H and reg56H. The default value of VLTF-WORK is set around -10℃ and VHTF-WORK around 55℃), which indicates battery temperature is too high or too low, then the boost is paused and IRQ is sent to notify Host. When battery temperature is back to the normal range, the boost will recovery automatically.

High temperature protection threshold hysteresis for VHTF-CHG and VHTF-WORK can be set through reg53H. Low temperature protection threshold hysteresis for VLTF-CHG and VLTF-WORK can be set through reg52H. The range of temperature detection can be expanded by adding more resistors.

Some battery may have no temperature sensitive resistor. Under this situation, TS pin can be pulled down to GND with a 10Kohm resistor externally or set as external input of ADC through register.

7.7.5 Charging indication

CHGLED pin uses open-drain/push-pull output method. It is internally pulled up to LDO. Its output drive capability is above 10mA. Detail function control is shown as the following table.

Table 7-4

REG69H [2:1] = 00 (Type A CHGLED) Open Drain	Hi-Z	No charging(conditions are not met or battery charged)
	25% 1Hz pull low/Hi-Z jump	Charger internal abnormal alarm(including timer out、die temperature over temperature、battery temperature out of charging range)
	25% 4Hz pull low/Hi-Z jump	Input source or battery over voltage
	Pull low	Charging
REG69H [2:1] = 01 (Type B CHGLED) Open Drain	Hi-Z	No VBUS, and power supply by battery
	25% 1Hz pull low/Hi-Z jump	Charging
	25% 4Hz pull low/Hi-Z jump	Alarm, including input source or battery over voltage, battery temperature out of charging range, timer out ,die temperature over temperature

	Pull low	No battery or charge finished, and power supply by VBUS
REG90H[2:0]=10 Cfg chgled	The output status is controlled by REG69H[5:4]	

Note: LED is on when CHGLED is low.

7.8 BATFET

BATFET connects system and battery. The on-resistance is low to 50mohm (point to point).

7.9 RBFET

RBFET connects VMID and VBUS. The on-resistance is low to 100mOhm (point to point). It supports input and output current limit function. In charger mode, the input current limit value of RBFET is set through reg16H [2:0].

7.10 ADC

AXP2101 has a low speed 14 Bits SAR ADC for measuring BAT voltage, Vbus voltage, Vsys voltage, TS voltage and die temperature.

Table 7-5

No.	Channel function	000H	001H	002H	…	FFFH
0	BAT voltage	0mV	1mV	2mV	…	8.192V
1	Vbus voltage	0mV	1mV	2mV	…	8.192V
2	Vsys voltage	0mV	1mV	2mV	…	8.192V
3	TS voltage	0mV	0.5mV	1mV	…	4.096V
4	die temperature	0mV	0.1mV	2mV	…	0.8192V

Note: ADC data is 14 bits. In order to get the complete data, TWSI must read the high 6 bits firstly and then the low 8 bits.

7.11 E-Gauge

The Fuel Gauge comprises of 3 modules: Rdc calculation module; OCV (Open Circuit Voltage) and Coulomb counter module; and calibration module. The Fuel Gauge system is able to export information about battery capacity percentage (regA4H), Battery Voltage (reg34H, reg35H). The Fuel Gauge can be enabled or disabled through reg18H [3]. The Battery low warning level can be set through reg1AH, and IRQ will be sent out to alert the platform when the battery capacity percentage is lower than the warning level set through reg1AH.

Once a default battery is selected for a particular design, it is highly recommended to calibrate the battery to achieve better Fuel Gauge accuracy. Once the calibration data are available, user can write the calibration information to battery parameter (REGA1) on each boot. Additionally, the Fuel Gauge system is capable to learn the battery characteristic on each full charge cycle. Information such as battery maximum capacity and Rdc will be updated automatically over time.

7.12 IRQ /BACKUP

7.12.1 IRQ

AXP2101 has an IRQ pin which is used to indicate whether there interrupt events occur.

PMU Interrupt Controller monitors the trigger events such as over voltage, over current, PWRON pin signal, over temperature and so on. When the events occur and their IRQ enabled bits are set to 1 (Refer to registers reg40H/41H/42H), corresponding IRQ status will be set to 1 (Refer to registers reg48H/49H/4AH), and IRQ pin will be pulled down. When Host detects triggered IRQ signal, Host will scan through the IRQ Status registers and respond accordingly. Meanwhile, Host will reset the IRQ status by writing “1” to status bit.

7.12.2 BACKUP

AXP2101 has a backup pin which is used to connect backup battery. It is the source of RTCLDO1 when pmu has only backup battery.

When PMU is poweron, the backup battery also cancan be charged by configuring reg18H[2] . The charger is working under linear mode with 100uA charge current and the termination voltage can be configured by reg6AH in range from 2.6V to 3.3V (default 2.9V).

The backup pin can also be configured for the RTCLDO2 by customization.

8. Register

8.1 Register List

Address	Description	R/W
0X00	PMU status1	R
0X01	PMU status2	R
0X04-0X07	DATA BUFFER	RW

Figure 10-2 AXP2101 Marking

Table 10-1 describes AXP2101 marking information.

Table 10-1 AXP2101 Marking Definitions

No.	Marking	Description	Fixed/Dynamic
1	AXP2101	Product name	Fixed
2	LLLLLXX	Lot number	Dynamic
3	XXX1	Date code	Dynamic
4		X-POWERS logo	Fixed
5	White dot	Package pin 1	Fixed

10.3 Carrier

Table 10-2 shows AXP2101 tray carrier information

Table 10-2 Tray Carrier Information

Item	Color	Size

Aluminum foil bags	Silvery white	540mm x 300mm x 0.14mm
Pearl cotton cushion(Vacuum bag)	White	12mm x 680mm x 185mm
Pearl cotton cushion (The Gap between vacuum bag and inside box)	White	Left-Right:12mm x 180mm x 85mm Front-Back:12mm x 350mm x 70mm
Inside Box	White	396mm x 196mm x 96mm
Outside Box	White	420mm x 410mm x 320mm

Figure 10-3 shows tray dimension drawing of AXP2101.

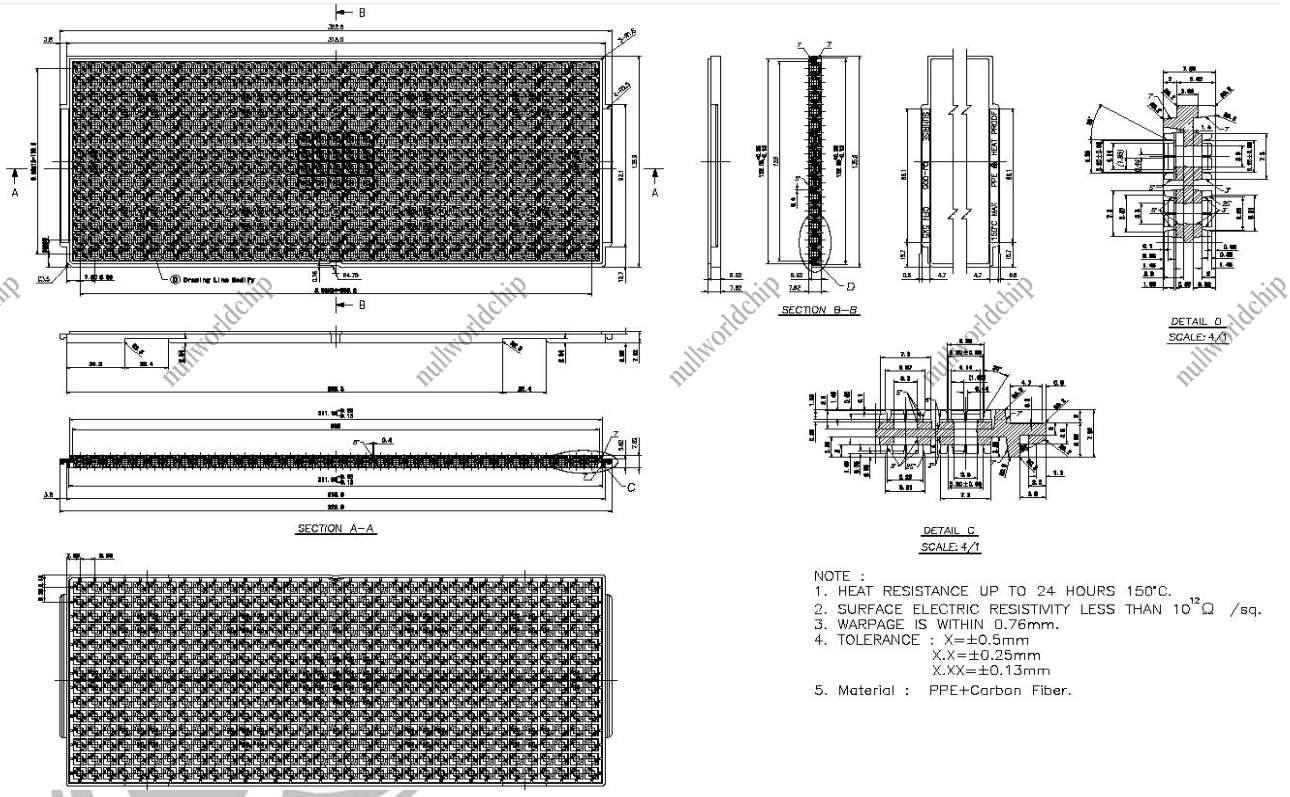

Figure 10-3 Tray Dimension Drawing

Table 10-3 shows AXP2101 packing quantity.

Table 10-3 Packing Quantity Information

Type	Quantity	Part Number
Tray	490pcs/Tray 10Trays/package	AXP2101

10.4 Storage

10.4.1 Moisture Sensitivity Level(MSL)

A package's MSL indicates its ability to withstand exposure after it is removed from its shipment bag, a low MSL device sample can be exposed on the factor floor longer than a high MSL device sample. ALL MSL are defined in Table 10-4.

Table 10-4 MSL Summary

MSL	Out-of-bag floor life	Comments
1	Unlimited	≤30℃/85%RH

2	1 year	≤30℃/60%RH
2a	4 weeks	≤30℃/60%RH
3	168 hours	≤30℃/60%RH
4	72 hours	≤30℃/60%RH
5	48 hours	≤30℃/60%RH
5a	24 hours	≤30℃/60%RH
6	Time on Label(TOL)	≤30℃/60%RH

AXP2101 device samples are classified as MSL3.

10.4.2 Bagged Storage Conditions

The shelf life of AXP2101 are defined in Table 10-5.

Table 10-5

Packing mode	Vacuum packing
Storage temperature	20℃~26℃
Storage humidity	40%~60%RH
Shelf life	6 months

10.4.3 Out-of-bag Duration

It is defined by the device MSL rating. The out-of-bag duration of AXP2101 is as follows.

Table 10-6 Out-of-bag Duration

Storage temperature	20℃~26℃
Storage humidity	40%~60%RH
Moisture Sensitivity Level(MSL)	3
Floor life	168 hours

For no mention of storage rules in this document, please refer to the latest ***IPC/JEDEC J-STD-020C***.

10.5 Baking

It is not necessary to bake AXP2101 if the conditions specified in Section 16.4.2 and Section 16.4.3 have not been exceeded. It is necessary to bake AXP2101 if any condition specified in Section 10.4.2 and Section 10.4.3 have been exceeded.

It is necessary to bake AXP2101 if the storage humidity condition has been exceeded. We recommend that the device sample removed from its vacuum bag more than 2 days should be baked to guarantee production.

Table 10-7 Baking Conditions

Surrounding	**Bake@125℃**	**Note**
Nitrogen	8 hours	Recommended condition. Not exceed 3 times.
Air	2 hours	Acceptable condition. Not exceed 3 times.
CAUTION： If baking is required, the devices must be transferred into trays that can be baked to at least 125°C. Devices should not be baked in tape and reel carriers at any temperature		

11. Reflow Profile

The reflow profile recommended in this document is a lead-free reflow profile that is suitable for pure lead-free technology of lead-free solder paste.

Figure 10-1 shows the typical reflow profile of AXP2101 device sample.

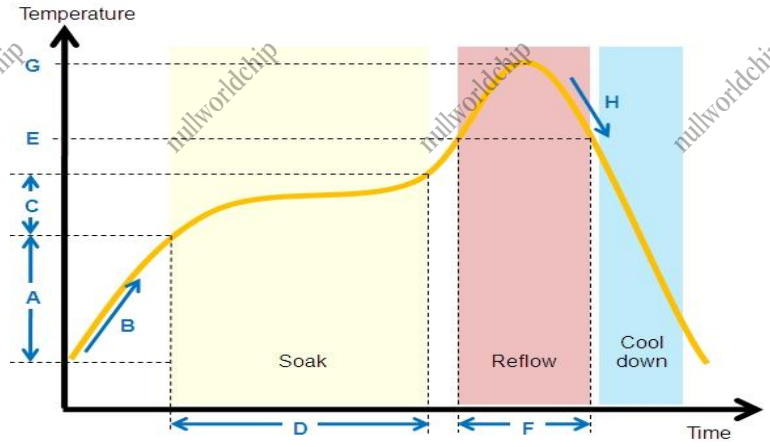

Figure 11-1 AXP2101 Typical Reflow Profile

Reflow profile conditions of AXP2101 device sample is given in Table 11-1.

Table 11-1 AXP2101 Reflow Profile Conditions

	QTI typical SMT reflow profile conditions (for reference only)	
	Step	Reflow condition
Environment	N2 purge reflow usage (yes/no)	Yes, N2 purge used
	If yes, O2 ppm level	O2 < 1500 ppm
A	Preheat ramp up temperature range	25℃ -> 150℃
B	Preheat ramp up rate	1.5~2.5 ℃/sec
C	Soak temperature range	150℃ -> 190℃
D	Soak time	80~110 sec
E	Liquidus temperature	217℃
F	Time above liquidus	60-90 sec
G	Peak temperature	240-250℃
H	Cool down temperature rate	≤4℃/sec

Declaration

THE PURCHASED PRODUCTS, SERVICES AND FEATURES ARE STIPULATED BY THE CONTRACT MADE BETWEEN X-POWERS AND THE CUSTOMER. PLEASE READ THE TERMS AND CONDITIONS OF THE CONTRACT AND RELEVANT INSTRUCTIONS CAREFULLY BEFORE USING, AND FOLLOW THE INSTRUCTIONS IN THIS DOCUMENTATION STRICTLY. X-POWERS ASSUMES NO RESPONSIBILITY FOR THE CONSEQUENCES OF IMPROPER USE(INCLUDING BUT NOT LIMITED TO OVERVOLTAGE, OVERCLOCK, OR EXCESSIVE TEMPERATURE).

THE INFORMATION FURNISHED BY X-POWERS IS PROVIDED JUST AS A REFERENCE OR TYPICAL APPLICATIONS. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS DOCUMENT DO NOT CONSTITUTE A WARRANTY OF ANY KIND, EXPRESS OR IMPLIED.
